Human Triggered Avalanche
Jan 30 2020

Snow Depth:
140 cm (4-5 feet)

Wind slab
broke here

Deeper, wider avalanche
could break here
on weak sugary snow

We triggered an avalanche of wind-drifted snow as we approached very carefully from a low angle slope above, on 1/30/2020. It broke within recently drifted snow, but these slides could be enough weight to break deeper and wider on sugary layers deep in the snowpack. Photo: GNFAC
