

South of Pika Point - Stable

Date

Sun, 02/12/2023 - 11:19

Activity

Skiing

Snowmobiling

Skied in the bowl to the south of Pika point on a north facing aspect.

ECTN28 on top of very large facets in the bottom ~30cm of snowpack, but no result on a CT conducted directly adjacent to the ECT.

I've included a snowpilot pit profile here. Took my best guess at grain type - it looked like the facets between 80cm and 30cm were beginning to round.

Later in the day noticed some small (D1, R1) wet loose slides on steeper south faces.

Region

Southern Madison

Location (from list)

Taylor Fork

Observer Name

Tyler Honsinger
