

Slide on north face of Blackmore

Date

Wed, 02/15/2023 - 12:18

Activity

Skiing

Low winds/no snow transport when I was up there and the east face had little to no wind effect, probably 16-18in new snow. Saw this slide with about a 8-12in crown and 100ft wide on the north face, didn't see any other activity aside from some small point releases on really steep east aspects.

From another party: Saw a sizable avalanche on the north east face of Blackmore, likely broke mid storm and was partly filled in already - estimated 20" deep, 100' wide. Had shooting cracks and collapsing while ascending northeast ridge. Hand pits showed planar results on an 8" harder slab beneath all the blower on top.

Region

Northern Gallatin

Location (from list)

Mt Blackmore

Observer Name

Ben Farrell
