Natural Avalanche on Climax Path

Woody Ridge Cooke City 4/2/2023 Code HS-N-R3-D3-O Elevation 10000 Aspect E Latitude 44.97390 Longitude -109.92400 Notes

From email: "Observed very limited terrain due to vis. Saw this very large avalanche on Climax. The crown looks fresh, so it likely occurred the day or night of 4/1? Hard to tell but the crown looks to be about 4-6' deep at its deepest. The debris ran to the creek. E aspect at 10000'.

There were also several smaller soft <u>slab</u> avalanches that ran on the lookers right side of Climax.

On 4/1 we had a large <u>collapse</u> on a SE <u>aspect</u> at 9800' where the MF crust was present under 60cm of new snow.

Winds were L-M with consistent gusts to S on Saturday."
