

Observations North of Cooke City

Date

Sat, 12/16/2023 - 14:15

Activity

Skiing

From email: "Miller Ridge [snowpit](#) from today: 9300', NE [Aspect](#). HS: 67cms. ECTP 11 at 36.

Then we toured over for some runs on SW Henderson. Obviously more supportable over there. Less collapsing.

Aside from the widespread SH that has been forming on all aspects and elevations this week, the shady aspects appear to be getting more faceted mid-snowpack, while the solar aspects appear to be gaining strength"

Region

Cooke City

Location (from list)

Miller Ridge

Observer Name
