

New Snow at the Ramp

Date

Sun, 01/07/2024 - 12:40

Activity

Skiing

We went to Bridger Bowl today and walked along the ridge to the Ramp. The west wind was calm and there wasn't any new snow being transported while we were walking. Snow remained mostly light (S1) with short bursts where snowfall increased (S2). We stopped at the top of Lazy Susan to dig, we found 6" of new snow sitting over old weak snow. Despite being just below the ridge this area was not wind-loaded and we found a well-preserved layer of 10-15mm [surface hoar](#). We had no results in [stability](#) tests, ECTX HS: 78 cm. During the descent of the ramp we triggered multiple sloughs in the new snow however they did not run far and were not big.

Region

Bridger Range

Location (from list)

The Ramp
