

Dirty snow

Date

Tue, 02/04/2025 - 12:45

Activity

Snowboarding

I went for a walk up the main fork of hyalite today and observed a very dirty snow surface from the strong SW winds, also the cornices are growing rather large from the recent wind

as the day progressed the snow surface became moist on any aspect that the sun kissed along with roller balls coming off rocky terrain

The dry powder took a beating from the warm temps in the alpine

Region

Northern Gallatin

Location (from list)

Divide Cirque
